Center:

A. Research Thrust Areas: Development of immunodiagnostic tests, identification and evaluation of vaccines & drugs for filariasis and evaluation of filarial immune modulatory proteins as therapeutic agents in autoimmune diseases.

The main thrust has been to apply the latest and sophisticated techniques of immunology and molecular biology in developing tools for immunodiagnosis, monitoring, immunoprophylaxis, surveillance and their application in the field for better management and control of the diseases namely Filariasis and Tuberculosis. The process for preparation of TB and filarial antigens are patented. Mycobacterial ES-31 serine protease was identified in TB infected human sera and reported for the first time and its usefulness as an antigen in diagnosis, cell marker to confirm MTB and as drug target for elimination of infection. Other major areas for research include - mechanisms of immunomodulation by helminths and their applications in autoimmunity, biological insight into proliferation & differentiation process of helminths and identification of novel anti-helminth drug targets using filariasis as a model, immunoscreening and surveillance of filarial endemic areas and development & validation of diagnostic, monitoring and prophylactic tools, immunodiagnosics and novel biomarkers for detection of tuberculosis, drug target identification, in silico identification of molecular markers of drug resistance, analysis of Chemokines & Cytokines in tuberculosis, anti-mycobacterial activity of selected marine algal extracts, viral infection (HPV) and cancer: unravelling the molecular complexities of HPV and apoptosis, screening of novel pathogenic genetic variants in BRCA1 gene in central India
